# MULTIOBJECTIVE IDENTIFICATION OF BOUNDARY TEMPERATURE USING ENERGY MINIMIZATION METHOD COUPLED WITH BOUNDARY ELEMENT METHOD 

Marek Jasiński<br>Silesian University of Technology, Gliwice, Poland, marek.jasinski@polsl.pl

#### Abstract

The inverse problem consisting in an identification of boundary temperature is discussed. As the identification method the Pareto approach with two criteria connected with domain and boundary has been used. In order to solve the problem the energy minimization method connected with boundary element method for steady state problem has been employed. The theoretical considerations are supplemented by the examples of computations verifying the correctness of the algorithm proposed.

## 1. Governing equations

Let us consider 2D problem of temperature identification on boundary $\Gamma_{1}[1,2]$ :

$$
\begin{cases}x \in \Omega: & \frac{\partial^{2} T}{\partial x_{1}^{2}}+\frac{\partial^{2} T}{\partial x_{2}^{2}}=0  \tag{1}\\ x \in \Gamma_{1}: & T(x)=? \\ x \in \Gamma_{2}: & T(x)=T_{b} \\ x \in \Gamma_{3}: & q(x)=-\lambda \frac{\partial T}{\partial n}=q_{b} \\ \xi^{i} \in \Omega: & T_{d}\left(\xi^{i}\right)-\text { known, } i=1 \ldots M\end{cases}
$$

where $\lambda[\mathrm{W} /(\mathrm{mK})]$ is thermal conductivity, $T$ denotes temperature, $T_{b}, q_{b}$ are the given boundary temperature and heat flux, $T_{d}\left(\xi^{i}\right)$ are the known temperatures at the internal points $\xi^{i}$ from the domain considered.

## 2. Energy minimization method coupled with the BEM

The boundary integral equation for problem (1) is of the form [4]:

$$
\begin{equation*}
B(\xi) T(\xi)+\int_{\Gamma} q(x) T^{*}(\xi, x) \mathrm{d} \Gamma=\int_{\Gamma} T(x) q^{*}(\xi, x) \mathrm{d} \Gamma \tag{2}
\end{equation*}
$$

where $\xi \in \Gamma$ is the observation point, $T^{*}(\xi, x)$ is the fundamental solution, while $q^{*}=-\lambda \partial T^{*}(\xi, x) / \partial n$ and $B(\xi) \in(0,1)$.

In numerical realization, the boundary $\Gamma$ is divided into $N$ constant boundary elements $\Gamma_{j}[1,5]$. Additionally, we assume that $N_{1}$ nodes belong to the boundary $\Gamma_{1}$, the nodes $N_{1}+1, \ldots, N_{2}$ belong to $\Gamma_{2}, N_{2}+1, \ldots, N$ belong to $\Gamma_{3}$ (Fig. 1). The integrals in equation (2) are substituted by sum of integrals and then, taking into account the boundary conditions (1), one obtains

$$
\begin{equation*}
\xi^{i} \in \Gamma: \sum_{j=1}^{N_{2}} G_{i j} q_{j}+\sum_{j=N_{2}+1}^{N} G_{i j} q_{b}=\sum_{j=1}^{N_{1}} H_{i j} T_{j}+\sum_{j=N_{1}+1}^{N_{2}} H_{i j} T_{b}+\sum_{j=N_{2}+1}^{N} H_{i j} T_{j} \tag{3}
\end{equation*}
$$

Fig. 1. The domain considered
where [4]

$$
\xi^{i} \in \Gamma: \quad G_{i j}=\int_{\Gamma_{j}} T^{*}\left(\xi^{i}, x\right) \mathrm{d} \Gamma_{j}, \quad H_{i j}= \begin{cases}\int_{\Gamma_{j}} q^{*}\left(\xi^{i}, x\right) \mathrm{d} \Gamma_{j}, & i \neq j  \tag{4}\\ -0.5, & i=j\end{cases}
$$

The well - ordered system of equations has the form

$$
\begin{equation*}
\mathbf{Y}=\mathbf{A}_{1}^{-1} \mathbf{A}_{2} \mathbf{P}=\mathbf{U P} \tag{5}
\end{equation*}
$$

where

$$
\mathbf{A}_{1}=\left[\begin{array}{llllll}
G_{11} & \ldots & G_{1 N_{2}} & -H_{1 N_{2}+1} & \ldots & -H_{1 N}  \tag{6}\\
& \ldots & & & \ldots & \\
G_{N 1} & \ldots & G_{N N_{2}} & -H_{N N_{2}+1} & \ldots & -H_{N N}
\end{array}\right]
$$

$$
\begin{gather*}
\mathbf{A}_{2}=\left[\begin{array}{llllll}
H_{11} & \ldots & H_{1 N_{2}} & -G_{1 N_{2}+1} & \ldots & -G_{1 N} \\
& \ldots & & & \ldots & \\
H_{N 1} & \ldots & H_{N N_{2}} & -G_{N N_{2}+1} & \ldots & -G_{N N}
\end{array}\right]  \tag{7}\\
\mathbf{Y}=\left[\begin{array}{llllll}
q_{1} & \ldots & q_{N_{2}} & T_{N_{2}+1} & \ldots & T_{N}
\end{array}\right]^{\mathrm{T}}  \tag{8}\\
\mathbf{P}=\left[\begin{array}{lllllllll}
T_{1} & \ldots & T_{N_{1}} & T_{b} & \ldots & T_{b} & q_{b} & \ldots & q_{b}
\end{array}\right]^{\mathrm{T}} \tag{9}
\end{gather*}
$$

The temperatures at internal nodes $\xi^{i}$ are calculated using the formula $[1,4]$

$$
\begin{align*}
T\left(\xi^{i}\right) & =\sum_{j=1}^{N_{1}} H_{i j}^{w} T_{j}+\sum_{j=N_{1}+1}^{N_{2}} H_{i j}^{w} P_{j}+\sum_{j=N_{2}+1}^{N} H_{i j}^{w} T_{j}-  \tag{10}\\
& -\sum_{j=1}^{N_{1}} G_{i j}^{w} q_{j}-\sum_{j=N_{1}+1}^{N_{2}} G_{i j}^{w} q_{j}-\sum_{j=N_{2}+1}^{N} G_{i j}^{w} P_{j}
\end{align*}
$$

From the system of equations (5) results that

$$
\begin{gather*}
q_{j}=\sum_{k=1}^{N_{1}} U_{j k} T_{k}+\sum_{k=N_{1}+1}^{N} U_{j k} P_{k}, \quad j=1,2, \ldots, N_{2}  \tag{11}\\
T_{j}=\sum_{k=1}^{N_{1}} U_{j k} T_{k}+\sum_{k=N_{1}+1}^{N} U_{j k} P_{k}, \quad j=N_{2}+1, N_{2}+2, \ldots, N \tag{12}
\end{gather*}
$$

Putting (11) and (12) into (10) one has

$$
\begin{align*}
& T\left(\xi^{i}\right)=\sum_{j=1}^{N_{1}}\left[H_{i j}^{w}-\sum_{k=1}^{N_{2}} G_{i k}^{w} U_{k j}+\sum_{k=N_{2}+1}^{N} H_{i k}^{w} U_{k j}\right] T_{j}+  \tag{13}\\
& +\sum_{j=N_{1}+1}^{N}\left[-\sum_{k=1}^{N_{2}} G_{i k}^{w} U_{k j}+\sum_{k=N_{2}+1}^{N} H_{i k}^{w} U_{k j}\right] P_{j}+\sum_{j=N_{1}+1}^{N_{2}} H_{i j}^{w} P_{j}-\sum_{j=N_{2}+1}^{N} G_{i j}^{w} P_{j}
\end{align*}
$$

or

$$
\begin{equation*}
T\left(\xi^{i}\right)=\sum_{j=1}^{N_{1}} W_{i j} T_{j}+Z_{i} \tag{14}
\end{equation*}
$$

where

$$
\begin{gather*}
W_{i j}=H_{i j}^{w}-\sum_{k=1}^{N_{2}} G_{i k}^{w} U_{k j}+\sum_{k=N_{2}+1}^{N} H_{i k}^{w} U_{k j}  \tag{15}\\
Z_{i}=\sum_{j=N_{1}+1}^{N}\left(-\sum_{k=1}^{N_{2}} G_{i k}^{w} U_{k j}+\sum_{k=N_{2}+1}^{N} H_{i k}^{w} U_{k j}\right) P_{j}+\sum_{j=N_{1}+1}^{N_{2}} H_{i j}^{w} P_{j}-\sum_{j=N_{2}+1}^{N} G_{i j}^{w} P_{j} \tag{16}
\end{gather*}
$$

In order to solve the problem considered, the energy minimization method is applied which resolves itself into seek of minimum of some functional with the following restrictions (c.f. equation (14)) [1-3]

$$
\begin{equation*}
\left|T\left(\xi^{i}\right)-T_{d}\left(\xi^{i}\right)\right|=\left|\sum_{j=1}^{N_{1}} W_{i j} T_{j}-F\left(\xi^{i}\right)\right| \leq \varepsilon, \quad i=1, \ldots, M \tag{17}
\end{equation*}
$$

where

$$
\begin{equation*}
F\left(\xi^{i}\right)=T_{d}\left(\xi^{i}\right)-Z_{i} \tag{18}
\end{equation*}
$$

## 3. Pareto approach

Multiobjective optimization (MOO) problem can be expressed as searching for the vector $\mathbf{x}$ from a set of admissible solution which minimizes the vector of $k$ objective functions [5]

$$
\mathbf{J}(\mathbf{x})=\left[\begin{array}{llll}
J_{1}(\mathbf{x}), & J_{2}(\mathbf{x}), & \ldots & J_{k}(\mathbf{x}) \tag{19}
\end{array}\right]^{\mathrm{T}}
$$

Vector $\mathbf{x}$ must satisfy the $p$ inequality constrains and $r$ equality constrains

$$
\begin{array}{ll}
f_{i}(x) \geq 0 & i=1,2, \ldots, p \\
f_{i}(x)=0 & i=p+1, p+2, \ldots, p+r \tag{20}
\end{array}
$$

According to the Pareto optimality concept, a point $\mathbf{x}^{*}$ is Pareto - optimal in the minimization problems if and only if there does not exist another point $\mathbf{x}$ such that

$$
\begin{equation*}
\mathbf{J}(\mathbf{x}) \leq \mathbf{J}\left(\mathbf{x}^{*}\right) \tag{21}
\end{equation*}
$$

and additionally at last one

$$
\begin{equation*}
J_{i}(\mathbf{x})<J_{i}\left(\mathbf{x}^{*}\right) \tag{22}
\end{equation*}
$$

The set of Pareto optimal solutions is called the Pareto front. In other words, it is a set of so-called non-dominated or efficient solutions.

A standard technique for identification Pareto - optimal points is minimization of weighted sums of functions called metacriterion [5]

$$
\begin{equation*}
K(\mathbf{x})=\sum_{i=1}^{k} w_{i} J_{i}(\mathbf{x}) \tag{23}
\end{equation*}
$$

where

$$
\begin{equation*}
\sum_{i=1}^{k} w_{i}=1 \tag{24}
\end{equation*}
$$

To obtain a set of Pareto front points, the minimization of set of functions (23) with different weights is demanded.

In current analysis, the bi-objective problem is considered with functional connected with boundary of the domain analyzed [3]

$$
\begin{equation*}
J_{1}=-\frac{1}{2 \lambda} \int_{\Gamma} T(x) q(x) \mathrm{d} \Gamma \tag{25}
\end{equation*}
$$

and connected with the interior of the domain

$$
\begin{equation*}
J_{2}=\sum_{i=1}^{M}\left[T\left(\xi^{i}\right)-T_{d}\left(\xi^{i}\right)\right]^{2} \tag{26}
\end{equation*}
$$

Both functionals are connected with minimization energy method through appropriate equations: (8), (9) for objective function $J_{1}$, and (14), (18) for functional $J_{2}$.

## 4. Examples of computations

The square of dimensions $0.1 \times 0.1 \mathrm{~m}$ has been considered. The thermal conductivity $\lambda=1 \mathrm{~W} / \mathrm{mK}$.

The boundary has been divided into 40 constant boundary elements. In order to solve the inverse problem, it is assumed that the values of temperature are known at 12 selected points from interior of the domain - Figure 2.

Fig. 2. Discretization and position of internal points

Temperatures at internal points have been obtained from the direct problem (1) solution for the boundary conditions collected in Table 1. The parameter $\varepsilon=0.5$, the distance between bottom side and sensors is equal 0.025 m .

## Boundary conditions

|  | 1st variant | 2nd variant |
| :---: | :---: | :---: |
| Left side | $\mathrm{Tb}=50^{\circ} \mathrm{C}$ | $\mathrm{qb}=0$ |
| Top side | $\mathrm{Tb}=100^{\circ} \mathrm{C}$ | $\mathrm{qb}=0$ |
| Right side | $\mathrm{Tb}=100^{\circ} \mathrm{C}$ | $\mathrm{Tb}=100^{\circ} \mathrm{C}$ |
| Bottom side | $\mathrm{Tb}=50^{\circ} \mathrm{C}$ | $\mathrm{Tb}=50^{\circ} \mathrm{C}$ |

Multiobjective optimization for several weights combination has been made. In Figure 3 the Pareto front obtained for $1^{\text {st }}$ variant of boundary conditions is presented.

Descriptions on the axes are defined as

$$
\begin{equation*}
J_{1}^{*}=J_{1}-J_{1 k} \tag{27}
\end{equation*}
$$

and

$$
\begin{equation*}
\stackrel{*}{J}_{2}=J_{2}-J_{2 k} \tag{28}
\end{equation*}
$$

where $J_{1}$ and $J_{2}$ correspond to the values of functional from single - objective optimization (or to weights combinations $w_{1}=1, w_{2}=0$ for $J_{1}$ and $w_{1}=0, w_{2}=1$ for $J_{2}$ ), while $J_{1 k}$ and $J_{2 k}$ are the Pareto optimal point co-ordinates obtained for $k^{\text {th }}$ weights combination.

In Table 2 the results of computations for selected weights combinations for $1^{\text {st }}$ variant of boundary conditions are shown.

## 5. Final remarks

In both variants of boundary conditions the differences between temperatures identified for selected set of weights are very small, however the differences in optimal values of metacriterion are clear visible (c. f. Tables 2 and 3). It should be pointed out that most of Pareto - optimal points are located closer to the optimal values of functional $J_{1}$ corresponding to Pareto optimal point co-ordinations for $w_{1}=1$ and $w_{2}=0$ (or to single - objective identification). Although for more precisely multiobjective identification the different functionals should be used, the algorithm proposed seems to be quite effective.
