# STURM-LIOUVILLE EIGENVALUE PROBLEMS WITH MATHEMATICA 

Urszula Siedlecka<br>Institute of Mathematics, Czestochowa University of Technology, Poland urszula.siedlecka@im.pcz.pl

#### Abstract

In this paper, the power series method is applied to a class of Sturm-Liouville eigenproblems. The procedure of a symbolic solution to the problem in the Mathematica program for Airy's differential equation representing the considered class of S-L equations is presented. An example of numerical results is given.

## Introduction

The Sturm-Liouville theory deals with the second-order differential equation

$$
\begin{equation*}
\frac{d}{d x}\left(p(x) \frac{d y}{d x}\right)+(q(x)+\lambda r(x)) y=0, \quad x \in(a, b) \tag{1}
\end{equation*}
$$

where $p, q, r$ and $p^{\prime}$ are real and continuous on interval $(a, b)$ known functions and $\lambda$ is a constant. Equation (1) comprises a wide class of ordinary differential equations of the second order. For example, the equation

$$
\begin{equation*}
a_{2}(x) y^{\prime \prime}+a_{1}(x) y^{\prime}+\left[a_{0}(x)+\lambda\right] y=0 \tag{2}
\end{equation*}
$$

can be written in the form of equation (1) assuming:

$$
p(x)=\exp \left(\int \frac{a_{1}(x)}{a_{2}(x)} d x\right), q(x)=\frac{a_{0}(x)}{a_{2}(x)} p(x), r(x)=\frac{p(x)}{a_{2}(x)}
$$

Sturm-Liouville (S-L) equations arise by using the method of separation of variables to solve linear partial differential equations (for instance, heat conduction equation, wave equation). Equation (1) is completed by the boundary conditions

$$
\begin{equation*}
\alpha_{1} y(a)+\alpha_{2} y^{\prime}(a)=0, \beta_{1} y(b)+\beta_{2} y^{\prime}(b)=0 \tag{3}
\end{equation*}
$$

where $\alpha_{1}, \alpha_{2}, \beta_{1}, \beta_{2}$ are real numbers.
An example of $S$-L differential equation is Airy's equation which occurs in the study of the diffraction of light and the deflection of a column that bends under its
own weight [1]. A collection of examples of S-L differential equations which are connected with problems in applied mathematics is given in paper [2].

In this paper the solution of an eigenvalue problem of the S-L type with ordinary points by using the Mathematica program is presented. The power series method for Airy's equation which represents the considered class of S-L problems was applied.

## Eigenvalue problem of S-L type

In this section we present the solution of a class of S-L eigenvalue problems assuming an expansion of the solution on an ordinary point. Using the program Mathematica, an exact solution and power series solution to the S-L problem with Airy's differential equation has been obtained.

## Exact solution of Airy's eigenvalue problem

We consider Airy differential equation in interval [0,1]:

$$
\begin{equation*}
-y^{\prime \prime}(x)+x y(x)=a \lambda y(x) \tag{4}
\end{equation*}
$$

The general solution of this equation obtained by using Mathematica is [3]

```
In[1] DSolve[-\mp@subsup{y}{}{\prime\prime}[x]+x y[x]==a \lambda y[x],y[x],x]
Out[1] {{y[x]->AiryAi[x-a \lambda] C[1]+AiryBi[x-a \lambda] C[2]}}
```

where AiryAi and AiryBi are Airy's functions [1]. The boundary conditions for function $y$ give two homogeneous equations

```
In[2] eq1 \(=y[0]==0\)
Out[2] AiryAi[-a \(\lambda\) ] C[1]+AiryBi[-a \(\lambda\) ] C[2]==0
In[3] eq2=y[1]==0
Out [3] AiryAi[1-a \(\lambda\) ] C[1]+AiryBi[1-a \(\lambda\) ] C[2]==0
```

For a non-trivial solution to the problem, the determinant of the coefficient matrix of the obtained equation system is set equal to zero. The determinant expressed as a function of parameter $\lambda$, can be written in the form

The graph of this function is presented in Figure 1. Zeros $\lambda_{i}$ of the function (eigenvalues) are numerically determined by using the bisection method. In Table 1 the first 10 eigenvalues are shown.

Eigenfunction $y[x, i]$, corresponding to eigenvalue $\lambda_{i}$ has the form

The graphs of the first five eigenfunctions are shown in Figure 2.
$\operatorname{In}[4] \quad \operatorname{Plot}[f[\lambda],\{\lambda, 0,100\}]$

## Power series solution of Airy's eigenvalue problem

Airy's eigenvalue problem presented in the previous section will be solved now by using the power series method. The solution to the problem with the program Mathematica is derived. The numerical calculations for a various number of terms of the series solution were performed. The Mathematica procedure of the program for five terms of the series solution is presented below. The procedure can be used in other Sturm-Liouville differential equations with ordinary points.

In [5]

```
Plot[{y[x, 1],y[x,2],y[x,3],y[x,4],y[x,5]},{x,0,1}]
```

Fig. 2. First five eigenfunctions of considered Airy's eigenproblem
We assume that the solution to the problem has form of the Taylor series

$$
\begin{equation*}
y(x)=\sum_{k=0}^{\infty} \frac{y^{(k)}\left(x_{0}\right)}{k!}\left(x-x_{0}\right)^{k} \tag{5}
\end{equation*}
$$

Using the Mathematica program, we approximate the solution to the problem by taking into account $n$ terms of series (5). In the considered Airy's eigenproblem, we assume $x_{0}=\frac{1}{2}$. Therefore, with Mathematica for $n=5$, we obtain:

In [6] sery=Series [y[x], $\{x, x 0, n\}]$
Out [6] $y[x 0]+y^{\prime}[x 0](x-x 0)+1 / 2 y^{\prime \prime}[x 0](x-x 0)^{2}+1 / 6 y^{(3)}[x 0]$
$(x-x 0)^{3}+1 / 24 y^{(4)}[x 0] \quad(x-x 0)^{4}+1 / 120 y^{(5)}[x 0](x-x 0)^{5}+0[x-x 0]^{6}$
In[7] sereq=Series [x y[x]-y''[x]-a $\lambda$ y[x], $\{x, x 0, n n\}]$
Out [7] (x0 y[x0]-a $\left.\lambda y[x 0]-y^{\prime \prime}[x 0]\right)+\left(y[x 0]+x 0 y^{\prime}[x 0]\right.$

$$
\left.-\mathrm{a} \lambda \mathrm{y}^{\prime}[\mathrm{x} 0]-\mathrm{y}^{(3)}[\mathrm{x} 0]\right)(\mathrm{x}-\mathrm{x} 0)+1 / 2\left(2 \mathrm{y}^{\prime}[\mathrm{x} 0]+\mathrm{x} 0 \quad \mathrm{y}^{\prime \prime}[\mathrm{x} 0]\right.
$$

$$
\begin{aligned}
& \left.-a \lambda y^{\prime \prime}[\mathrm{x} 0]-\mathrm{y}^{(4)}[\mathrm{x} 0]\right)(\mathrm{x}-\mathrm{x} 0)^{2}+1 / 6 \quad\left(3 \mathrm{y}^{\prime \prime}[\mathrm{x} 0]+\mathrm{x} 0 \quad \mathrm{y}^{(3)}[\mathrm{x} 0]\right. \\
& \left.-\mathrm{a} \lambda \mathrm{y}^{(3)}[\mathrm{x} 0]-\mathrm{y}^{(5)}[\mathrm{x} 0]\right)(\mathrm{x}-\mathrm{x} 0)^{3}+1 / 24 \quad\left(4 \mathrm{y}^{(3)}[\mathrm{x} 0]+\mathrm{x} 0 \quad \mathrm{y}^{(4)}[\mathrm{x} 0]\right. \\
& \left.-\mathrm{a} \lambda \mathrm{y}^{(4)}[\mathrm{x} 0]-\mathrm{y}^{(6)}[\mathrm{x} 0]\right)(\mathrm{x}-\mathrm{x} 0)^{4}+1 / 120 \quad\left(5 \mathrm{y}^{(4)}[\mathrm{x} 0]+\mathrm{x} 0 \quad \mathrm{y}^{(5)}[\mathrm{x} 0]\right. \\
& \left.-\mathrm{a} \lambda \mathrm{y}^{(5)}[\mathrm{x} 0]-\mathrm{y}^{(7)}[\mathrm{x} 0]\right) \\
& (\mathrm{x}-\mathrm{x} 0)^{5}+0[\mathrm{x}-\mathrm{x} 0]^{6}
\end{aligned}
$$

## In [8] syseqs=LogicalExpand [sereq=0]

Out [8] $x 0 y[x 0]-a \quad \lambda y[x 0]-y^{\prime \prime}[x 0]=0 \& \&$

$$

```

Determinant det as a function of parameter $\lambda$ in a polynomial form is used for the numerical calculations of eigenvalues. The numerical results of the eigenvalues for various numbers $n$ of terms of the series solution and eigenvalues obtained from the exact solution in Table 1 are compared. When the number of terms of the series is too small, then the degree of the polynomial is also small and only a few first eigenvalues can be calculated (see Table 1).

## Conclusions

The use of Mathematica to solve Sturm-Liouville eigenvalue problems has been presented. Although the eigenvalue equation was derived for a selected eigenproblem (Airy's differential equation), the approach can be used for a class of differential equations with ordinary points. In the case of $S$-L differential equations with regular singular points, the indicial equation must be first solved and next the procedure presented here can be applied. The numerical calculations of the eigenval-
ues have shown that the approximate power series solution gives correct results when a sufficiently large number of terms of the series is assumed.
